SUMMARY

Full stack software engineer with production experience building modern web applications using JavaScript, TypeScript, Node.js, and React. Comfortable across the entire stack, from designing and implementing REST APIs and real-time WebSocket services on the backend to building responsive, data-driven interfaces on the frontend. Has deployed applications on AWS using Docker and CI/CD pipelines. Experience integrating AI tools including Claude and ChatGPT into production workflows. Bilingual English/Spanish.

SKILLS

- **Frontend:** JavaScript (ES6+) · TypeScript · React · Next.js · Vue.js · HTML5 · CSS3 · WebSockets · DOM manipulation
- **Backend:** Node.js · REST APIs · JWT · OAuth 2.0 · session-based authentication · Express.js · WebSocket servers
- **Databases & SQL:** PostgreSQL · MongoDB · joins · aggregations · CTEs · window functions · query optimisation
- **Testing & Tools:** Postman · API validation · Git · Agile / Scrum · Docker · Docker Compose · GitLab CI · GitHub Actions
- **AI Integration:** Claude Code (MCP) · ChatGPT API · n8n automation

EXPERIENCE

Altamira

Apr 2026 - Present

Fullstack Developer

Metepec, Mexico

- Eliminated duplicate and lost real-time events across frontend components by implementing **WebSocket**-based event handling with deduplication, removing the need for page reloads.
- Streamlined ingestion of external data by building **REST endpoints** that transform, enrich, and route incoming JSON payloads, validating correctness with **Postman** throughout development.
- Restored data accuracy across a **Vue.js** security analytics platform by diagnosing and resolving real-time visualization inconsistencies, tracing the full data flow from REST endpoints to charts and dashboards.
- Reduced inconsistent error handling across the codebase by standardizing REST endpoints for authentication, session management, and pagination, using **Docker** and **GitLab CI** to keep deployment environments consistent.

Brigham Young University - Idaho

Sep 2025 - Dec 2025

Volunteer

- Delivered a university tour booking SaaS platform end-to-end by co-developing the **Next.js (React)**, **Node.js**, and **PostgreSQL** frontend and backend.
- Gave students and staff a fully responsive scheduling and administrative experience by building UI for booking, staff management, analytics dashboards, and inventory modules backed by **PostgreSQL**.
- Eliminated stale appointment availability by integrating real-time booking via **Socket.IO**, giving connected clients instant slot updates without page refreshes.

HeartCentrix Solutions

Mar 2025 - Jul 2025

Intern

- Enabled business-critical internal web applications by developing **RESTful APIs** in **Spring Boot** connected to **PostgreSQL**.
- Secured application access across every layer by implementing **JWT**-based authentication and session management.
- Cut average API response times by **15%** by analyzing and optimizing **SQL** queries and identifying persistence-layer bottlenecks.
- Maintained environment parity across development, staging, and production by containerizing core services with **Docker**, while collaborating in **Agile sprints** on peer code reviews and Git branching strategy.

EDUCATION

Brigham Young University - Idaho

Jan 2021 - Jul 2025

Bachelors in Computer Science, Minor in Data Science

- **GPA:** 3.5

PROJECTS

tally-split — Real-Time Group Expense Splitter

Node.js, Express, PostgreSQL, React, TypeScript, WebSockets

- Delivered live, multi-user balance updates with zero manual refresh by building a fullstack expense-splitting app (Node/Express/PostgreSQL backend, React frontend) with **WebSocket**-based sync, verified against a real socket server in integration tests.
- Cut the payments needed to settle a group's expenses to at most N-1 for N members by designing a debt-settlement algorithm with a provable transaction bound, verified correct across **200 randomized test scenarios**.
- Guaranteed cent-accurate totals on every equal, exact, or percentage-based split by implementing a largest-remainder allocation method, validated across **43 automated tests** covering all money math and API flows.
